DOING FIELDWORK IN A PANDEMIC

Crowdsourced document initiated by Deborah Lupton (@DALupton, d.lupton@unsw.edu.au) on 17 March 2020. Please do add comments and resources below as appropriate

Isolation measures to contain the spread of COVID-19 means that social researchers who conduct face-to-face fieldwork (interviews, focus groups, participant observation, ethnographies etc) are now faced with the challenge of either delaying or re-inventing their methods so that they can continue their research until these measures are relaxed.

This crowdsourced document provides a space for people to share their methods for doing fieldwork in a pandemic - specifically, ideas for avoiding in-person interactions by using mediated forms that will achieve similar ends.

Social research has been conducted online for many years, of course. There are many examples of using online survey tools or doing content analyses or ethnographies using existing online interactions as research materials. Interviews have been conducted by phone or Skype for a long time. This document was initially directed at ways for how to turn fieldwork that was initially planned as using face-to-face methods into a more ‘hands-off’ mode. However, people have added useful material about ‘born digital’ research (content already generated on the internet by online interactions), which provides an alternative source of social research materials if researchers decide to go down that path.

Please add your ideas below - and do share useful references if available.

NB: Deborah also curates a community Facebook page ‘Innovative Social Research Methods’ which may be of interest for those wanting to think about new and creative ways of doing social research. Innovative Social Research Methods Public Group

If you are interested in focusing on COVID-related topics (and let’s face it, we are all researching in a COVID-world now), see Deborah’s post on an initial research agenda for social research: Social Research for a COVID and Post-COVID World: An Initial Agenda

Photo/Video/Voice Elicitation

A method that involves asking research participants to use a camera or voice recording app (often on their smartphone) to take photos or make videos or voice memos about their everyday practices and interactions that they can then share with the researchers. Researchers can provide them with questions or prompts to direct their recordings and documentations.

Diaries/journaling

These methods can also be combined with asking participants to complete diaries or journals using pen and paper, voice memos or online platforms or apps. Diaries can also be combined with interviews and other methods, where sometimes the diary can act as a prompt for further discussion. Diaries can be structured (like questionnaire) and aiming for quantitative analysis, or semi- or unstructured - asking for more free-flowing reflection. Keeping in touch with participants is very important, especially for longer-term studies, as this maintains participation (attrition can be an issue). Also receiving some entries early on in the process and giving feedback may help as sometimes relevance can be an issue too. Diaries can be used over months or hours, depending on the focus of the study. They can use interval-based sampling (i.e. record something every hour or every day) or event-based (i.e. record something when it occurs, which may be more irregular). Diaries can take many different forms including visual, collage, photo-based as well as written or spoken - it is important to consider the participants and what they would find easy to use (ask them - piloting is essential) and also what you will be able to analyse within the analytical approach you have chosen.

[If it’s ok to add some things to this - here’s some more diary research suggestions - suggestions/annotations by Emily Henderson @EmilyFrascatore - feel free to contact me about diary research!]:

3 great guide books on this type of research:

Day, M., & Thatcher, J. (2009). “I’m Really Embarrassed That You’re Going to Read This…”: Reflections on Using Diaries in Qualitative Research. *Qualitative Research in Psychology*, 6(4), 249-259. doi:10.1080/14780880802070583 [A useful paper on how diaries can be used - advantages as well as challenges]

Harvey, L. (2011). Intimate reflections: private diaries in qualitative research. *Qualitative Research*, 11(6), 664-682. doi:10.1177/1468794111415959 [A fascinating method where participants keep diaries but don’t show them to the researcher - the diaries act as prompts]

Along these same lines, Markham has done ethnographic study of youth who use a variety of tools, including diaries, that they don’t show to the researcher, but use as prompts. Written up here: Markham, A. N. (2018). Critical pedagogy as a response to datafication. Qualitative Inquiry, Online First edition at https://doi.org/10.1177/1077800418809470 (personal copy shared here)

Waddington, K. (2005). Using diaries to explore the characteristics of work-related gossip: Methodological considerations from exploratory multimethod research. *Journal of Occupational and Organizational Psychology*, 78(2), 221-236. doi:10.1348/096317905X40817 [This one really picks up how diaries can help to record data from scenarios that would not be easily researched using e.g. observation]

Re-enactment Videos

Re-enactment videos have been used in ethnographic fieldwork as a way of documenting people’s everyday practices (often in the home). Researchers have usually done the video-making as they follow their participants around, asking questions as they go. This method can be revised to ask the participants to make their own re-enactment videos, using their phone or possibly provided with a wearable video camera, such as a GoPro action camera (see more below) and then sharing the videos online with the researchers.

References

Using Wearable Cameras (and other first-person perspective tech)

Using small wearable cameras such as GoPro action cameras (often used by people to film their participation in action sports) can be a way of doing ‘walk-alongs’ - or in the case of the project by Pink, Sumartojo and colleagues cited below, ‘ride-alongs’. They gave a GoPro to cyclists to wear
on their helmets during one of their regular commutes to work. The camera was turned on by the cyclist when they were preparing to leave for work, recorded their ride and was turned off once they had reached their destination. The videos were viewed together by the researchers and the participants, with questions asked about the cyclists' experiences of using self-tracking devices and reviewing their data. This post-video interview could be conducted using Skype or similar, or could be combined with cultural probes, diaries or the like.

Think of the many possibilities of using these kinds of wearable cameras for ethnographic research - dance-alongs, eat-alongs, sing-alongs ….

Epistolary Interviews

Epistolary interviews, first described by Debenham (2001), are asynchronous, one-to-one interviews mediated by technology.

The method allows both interviewer and respondent to select suitable interview times, provides time to consider questions and responses, and eliminates the need for transcription. The interviewer sets the pattern for the formality of the interview, ensuring that the online format is
used to organise and facilitate talk rather than to constrain it (Ferguson, 2009). Length, aims and format of the interview, the need for spontaneous or researched responses, and whether reference can be made to external material should be established at the outset.

As interviewer and respondent do not need to be co-present in time, respondents are empowered by being able to choose when to respond. They have time to consider their answers and can, if they choose, make reference to supporting materials. The method also allows a researcher to conduct several interviews simultaneously, so data from one interview can be tested in or used to develop other interviews.

The epistolary nature of such interviews means that, as in a sequence of written letters, a relationship between the correspondents can be established and developed. This can produce thoughtful exchanges in which both interviewer and respondent have opportunities to consider, clarify and expand their meaning.

The method does not aim for neutrality but builds a relationship between researcher and respondent that supports interpretation of the data. To give consistency to the data, the main questions can be worded in the same way each time they are presented.

Some researchers have been experimenting with messaging apps, such as WhatsApp, to conduct these kinds of interviews (see section on app-based methods below).

**Online Discussion Platforms**
Instead of conducting focus groups face-to-face, there are platforms available that can customise an online group discussion that can be moderated in real-time. You can upload your questions and check in to observe people typing in their answers, meaning you can ask them to elaborate or explain in real-time. Settings can be arranged so that participants can see each others’ responses in real-time if you wish to encourage a group discussion. The discussion can be held over a number of days to allow people time to participate or add to their responses.

Cultural/Mobile Probes

This is an approach from design research, involving developing kits of materials that are left with research participants to complete in their own time. Once completed, they can be sent back to the researchers. Traditionally, these materials are analogue: paper cards with instructions for completion (invented by Bill Gaver and team). Probes may also be sent to participants, completed and sent back via mobile phones. The approach is then called mobile probes.

Probes do not provide ‘information’ as hard data, but rather should be seen as providing a glimpse into people’s lives and inspiration for the designer. Tasks often have a creative element - and people are more likely to engage with fun tasks or tasks that give them some creative agency than with pure information gathering and diaries. But one needs to be careful that tasks do not feel overwhelming. Typical tasks can include postcards with a question to answer, a map to annotate, a task to photograph the first object one notices consciously on the way out of the
house (or something in the house that has always been annoying etc), game-style elements can be used, they can include audio-recordings and so on.

Physical kits tend to work well, as the physical objects are reminders of what to do. Thus, how to do this online, might be a challenge. One way to get around this is to send materials by snail mail and ask participants to return them the same way.

References

The Story Completion Method

Story completion is a writing method that can take place in face-to-face situations using pen and paper but can also be conducted using online tools such as SurveyMonkey. Alternatively, mail can be used to send the prompts to participants and they can complete them in their own time, as is often the case with cultural probe materials. The method involves the use of story ‘stems’, in which a fictional character is introduced and commonly, they face a dilemma they need to resolve. Participants are asked to complete the story. The completed narratives are then
analysed for what they reveal about understandings, discourses or imaginaries concerning the topic of the story stems.

A novel research method for workshops and co-production of knowledge: using a secret Facebook group (Pre-print link: https://www.researchsquare.com/article/rs-14643/v1)

ABSTRACT:

Background: Co-production is reliant on good communication and consensus between participants but attending in-person meetings and workshops is hard for time-constrained groups such as new mums, who may be geographically dispersed without reliable transport. Discussions with a lay advisory group resulted in the decision to hold a workshop over a secret Facebook group. The aim of this study was to test the feasibility of a secret Facebook group for co-production activities. In the example presented here, the population was women with previous gestational diabetes; the topic was physical inactivity; and the purpose was to develop an acceptable intervention to increase physical activity.

Methods: The researchers created a secret Facebook group with content similar to an in-person workshop that sequentially progressed to develop a programme theory for an intervention. The researcher posted 1-2 times per day for 14 days and members of the group were invited to comment and discuss the content. Feasibility and acceptability of the group analysed using Facebook analytics and a post-workshop survey.
Results: Twenty-one participants took part. In total, 521 comments were provided in response to 18 posts of varying types (average = 28.9 comments per post). The total word count of participant comments was 21,142 words. The workshop was viewed positively, with 20 of 21 participants saying they liked the workshop ‘somewhat’ or ‘a great deal’, and felt the group was a safe and open environment to share opinions. When asked if they would take part in something like this again, 15 of 21 said “Yes”. Participants mentioned the format was convenient; it allowed them to reflect on their own experiences and they liked helping research progress. Those who say “yes” said it was difficult finding time and depended on what else was going on.

Conclusion: Using a secret Facebook group as a method of co-production or as a workshop in the research process is a feasible and acceptable method. Social media holds significant potential for co-production and involvement in research for populations who are geographically dispersed or time-constrained; with an uncommon condition; or in other circumstances where in-person meetings are either not appropriate or not possible.

Using Google/Microsoft Forms for Data Collection

Google forms could be used to collect basic demographic information and ask open questions.

More on using the Google platform:
https://www.thinkwithgoogle.com/marketing-resources/data-measurement/google-plus-qualitative-research-best-practices/

GDPR is important. QUALTRICS (although it requires a paid license)
http://www.qualtrics.com

added by Mark Wong, University of Glasgow, @UoG_MarkWong:
N.b. Google Forms is not GDPR compliant in EU countries and the UK, as data are not stored on servers located within the EU.
Microsoft Forms (part of Office365) is an easy-to-use tool to set up online questionnaires, opinion polls, and quizzes. Easy to make visually appealing questionnaires quickly.  
https://forms.office.com/

OnlineSurveys.ac.uk (formerly known as Bristol Online Surveys) is a UK-based tool commonly used to set up online questionnaires, which is more targeted towards academic research.  
https://www.onlinesurveys.ac.uk/

Institutional/personal accounts may be required for the above tools. If you are using Microsoft Forms/Office365 via an institutional account, check with your institution data management team/guidelines to ensure data is saved within the EU only.

SurveyMonkey is also a quick and easy (and free for basic use) online survey tool.

The Ethics of Moving from Face-to-Face Fieldwork

This section is for discussing ethical issues related to moving from face-to-face to remote fieldwork. For a start, if your human research ethics committee has already approved your face-to-face methods and you wish to modify these along the lines of some of the suggestions above, most ethics committees will require a modification request and approval process.

You will also need to consider the 'affective atmospheres' of conducting any kind of social research in a pandemic, when normal routines are disrupted and many people are feeling uncertain and worried, or are ill or caring for ill family members. People may be living in environments where they are subjected to harassment, violence or surveillance by other family members. Privacy issues are very important to consider in these contexts.

On the other hand, with people more confined, feeling bored or restless but in good health, they may welcome the opportunity to be part of a research project. Consider your target participant group very carefully when making decisions about the best way forward.

If you decide to use online data collection methods that engage with pre-existing material people have uploaded (as opposed to material you have specifically asked them to generate following a consent process, which includes many of the methods listed here), you will need to carefully consider the ethical issues. Check the Association of Internet Researchers’ document discussing these issues, available here: IRE 3.0 - final-includes missing reference
Some guidelines on anthropological fieldwork generally (mostly related to in-person methods) can be found at ASA Ethics Guidelines.

**GDPR issues**: some researchers in Europe have raised concerns about how to conduct digitised fieldwork and remain compliant with the GDPR. These matters certainly deserve attention. See below for some links discussing relevant issues.

**Books on Innovative and Creative Methods**

**Autoethnography (added by F. Güzin Agca-Varoglu)**
The autoethnographic method gives the opportunity to create a research, where the researcher puts “self” in the process as a subject. My students had to visit places like cafes, hospitals, tea-houses, mosques, museums etc. for their fieldwork. Because of the outbreak I want them to write an autoethnographic essay drawn on social distance experiences and also temporal/spatial change in their everyday lives. It could be a substitution for cancelled homework in this period that they should stay away from other people.

References

**Duoethnography (added by Vibeke Oestergaard Steenfeldt)**

In continuation of autoethnography I would like to pay attention to duoethnography. When it can be difficult for students to get access to patients or other informants they can be encouraged to investigate a phenomenon based on their own experiences e.g. by interviewing each other mutually.

Netnography/Virtual Methods (added by Gabriella Wulff)

I often use netnography/virtual methods to conduct ethnographic research online. I also recommend my students to look into the research. Here are some reading suggestions:

I also found this one, that might be useful:

*Added by Lisanne Wilken*

As part of our methods class at Global Studies, Aarhus University I use the following texts to introduce (n)ethnography to an interdisciplinary group of students:

**18th November: Data collection online, challenges, practices, ethics.**

During this lesson, we will discuss the possibilities and obstacles of doing online ethnography and studying social media

**Reading:**

**25 November Case study analysis**

During the class, we will decipher different social media cases and discuss topics for the portfolio paper on social media/online ethnography
Digital Methods and Quali-Quant analysis (added by Anders Kristian Munk)

I encourage my students to consider ways in which computational analysis of born digital material can complement fieldwork (e.g. as a way to map relational fields) and/or be thought of as a form of fieldwork in its own right (e.g. by locating digital traces in specific media cultures/socio-technical infrastructures or by using computation exploratively and descriptively to discover questions and concerns from actors online).

Suggested readings:

For our own controversy mapping students I have made the following set of tutorials centered on Wikipedia as a field and introducing a range of digital methods/techniques:

- https://medium.com/@EthnographicMachines/introduction-to-semantic-analysis-with-cortext-19f355b7289a

Using YouTube (and Online Video) for (Teaching) Observational Studies
(added by Robin Smith)

YouTube (other video platforms are available…) has increasingly been used by those carrying out observational studies, sometimes as a means to access perspicuous phenomena that are hard to access, at other times as means to an end (my ethnography students are currently facing this challenge). A number of ethnomethodological studies have used YouTube and online video as data and there is no good reason that ethnographers more generally who are interested in things like interaction in public space, family interactions, public disputes, protests, the circulation of violence etc etc, shouldn’t make use of the resource. Some papers (including a discussion of the ethics of ‘any-misation’ (Laurier, 2016) and studies indicating the kinds of possibilities and possible topics below (please add!!):

Laurier, E. (unpublished) Youtube: using third party video as research data
Lloyd, M. " You just took the jump too slowly": A single case analysis of a mountain bike crash. Social Interaction.

(added by Mikael Quennerstedt)
Using YouTube for visual data is as I see it quite underused.

“Burgess and Green (2009) argue that YouTube can make sense when it is understood as something that people use in daily life, and that YouTube can be regarded as ‘a massive, heterogeneous, but for the most part accidental and disordered, public archive’ (p. 88). In this way, the video clips used in this study, posted by both students and teachers, can be seen as an archive, as reports of ongoing PE practices. This ‘archive’ opens up for studies using a wide sample of participatory created data from PE practices.” (Quennerstedt, 2013a)

In Quennerstedt (2013b) YouTube clips used were mainly ‘diary entries’ in terms of my-typical-day-in-school clips, displaying an event in school important enough for the students to film and important enough to post on their user channel.

However there are always ethical concerns when using publicly private data. Some discussions and references can be found in Quennerstedt (2013c).

Using Podcasts to Study Culture

Podcasts are serialized audio broadcasts, akin to radio broadcasts, that are digitally produced for public consumption. Podcasters, or the producers and hosts, tend to be motivated by love of the topic of their podcast and a desire to share and promote that topic (Markman, 2012). Moreover, podcasts are plentiful—with over 800,000 active podcasts and over 50 million episodes (Adgate, 2019)—and may be a valuable source of extant data to complement other elicited perspectives (e.g., via interviews or focus groups). As cultural artifacts created outside of a research context, these carry a sort of naturalistic quality that lends credibility while also demanding careful contextualization—who produced, for what audience, at what time, etc.? As with other public data repurposed for research ends, ethical questions arise around privacy, intent, and interpretation. These concerns might be mitigated by considering the self-reported purpose of individual podcasters and comparisons to alternative methods of engagement. For example, Abdolrahmani et al. (2020) chose this method because researchers’ goals aligned with those of visually impaired podcasters: to reveal accessibility and usability challenges of voice assistants. Using podcasts produced by and for members of a marginalized community, specifically the visually impaired community, sidestepped the undue burden or undue inducement that
elicitation methods posed. Finally, including people with disabilities in leadership roles on the research team supported nuanced interpretation of recordings from an insider perspective. Popular podcast repositories that are searchable include Apple Podcasts, Stitcher.com, and Spotify.

Big Brother Style Observations

If research is about people’s activities and behaviour, having consent to carry out live on-line observations might work well during these times. Researcher places a camera in the home of the participants at a particular agreed room and it gets turned on and off at convenient times where a) activity is taking place and b) it’s convenient and appropriate for the people being observed.

Just a thought as I read this doc. Great initiative!

Experimenting with Online Live Action Role Play (O-LARPs) (added by Alex Taylor)

I’ve been involved in *Live Action Role Play* (LARPs) as a method for imagining futures (specifically for a project on *Algorithmic Food Justice*). We worked with the Arts Collective Furtherfield who have been developing this as a method. I think there might be ways to move this into the online realm. You’d need to rethink how materials can be integrated into roles and interactions, and probably experiment with different platforms. It might be interesting to take over gaming platforms, possibly something like Roblox.

References
As an example, see *Planet Cashless 2029*, via Furtherfield.

LSE Digital Ethnography Collective Reading List

Available here: Digital Anthropology/Ethnography

**Arts-based project combined with Skype interviews** (added by Nicole Brown)

I use arts-based approaches (e.g. work with metaphors, objects, Lego models, collages, etc.) and combine that with Skype interviews, where I hold inter-views (Brinkmann and Kvale, 2015) as conversations between the researcher and the participants to make sense of what the arts-based project means and stands for. Participants are given a question (e.g. Who are you? What affects you?) and are asked to find a representation of the response and to take a photo of that/collage etc and to share that via email with a very brief statement of what they are trying to say. Once you have collected all the data that way you can then arrange for that Skype call to hold a conversation. As a researcher, you can then analyse the representation and the transcript from the interview.

The basis for this approach: human understanding is embodied (Finlay, 2008, 2015) and metaphorical (Lakoff and Johnson, 2003), language is insufficient to explain or describe certain experiences such as pain (e.g. Sontag, 2003; Scarry, 1985), and arts-based approaches can bridge that gap (e.g. Leavy, 2015; Denzin, 2016).

Creating Social Media Platforms/ Groups for Research and Researching Social Media Platforms

Online Surveys, virtual interviews and social media screenshots (Added by Jessica Ringrose and Kaitlynn Mendes)

We have used qualitative questionnaires, virtual interviews, and social media data gathering in two projects on social media activism. For a project on digital feminist activism part of the method involved an online survey ( surveymonkey) with qualitative answers to questions about experiences of online feminist activism. Twitter has been identified as a useful platform for conducting qualitative research into “situated knowledge’s” since it is “based around curated, cultivated identities ... and their interactions with other entities.” (in Stewart, 2017: 254). We therefore began by conducting a survey through our own Twitter networks. Initially, using our project Twitter handle, we tweeted a survey link, soliciting no responses— largely because we had few followers. We then asked our Research Assistant, a self-defined Twitter feminist with over 4,000 followers, to retweet the survey link generating 47 responses. One of the responses was removed for being “fake” and constituting trolling, leaving us with 46 valid survey responses: 4 adult men, 27 adult women, and 15 teenaged girls. Albeit a small sample, the responses were richly descriptive regarding participants’ experiences of using Twitter for feminist activism, and specifically to combat rape culture. The survey was anonymous, but it invited participants to share their contact details to participate in semi- structured interviews via Skype, email, or in person. Through this strategy we recruited 21 further responses (from England, Ireland, USA, Canada Nigeria and Saudi Arabia) including 13 Skype interviews, one in-person interview, and seven further more in-depth follow-up questionnaires tailored to their previous responses via email. During the mostly Skype interviews we also asked if participants could send us screenshots of salient online exchanges they had experienced, such as
trolling, or the types of content that they retweeted with explanations. This method could be enhanced and more in-depth through using Digital Social Media Diaries (see Volpe, 2019). We also took an in-depth look at the participant’s Twitter account post-interview to consider the issues they were tweeting about and why (for instance school girls tweeting about sexist dress codes and rape culture at school) (see Ringrose and Mendes, 2018). Through this method we were able to triangulate data for instance around the prevalence of participants who challenged trolling in the sample (44/46), the qualitative experiences of trolling episodes, and screen shots of social media extracts demonstrating the trolling tweet exchanges or responses (see Mendes et al., 2019). A follow up project looked at experiences of contributing to #MeToo, and we adopted a similar technique as above. We posted a link to an online survey on our Twitter accounts asking colleagues to share and spread. We asked for those who contributed to the hashtag to respond and forward the survey to others in their network via snowball sampling. The survey recruited 117 participants, including 115 females and 2 males, ranging from 18-64 years old with responses from UK, Sweden, Greece, Australia, the Netherlands, Canada and the USA. The survey also asked participants to leave an email contact if they were interested in taking part in a follow-on-interview. Through this method, we recruited 7 additional participants (6 females, 1 male), based in the UK, the Netherlands, and Greece. Through these follow on interviews, we were able to ask follow-on questions to key themes emerging from the survey responses (such as why people may have contributed to the hashtag without sharing a personal story), and to ask participants to give more detail about the conflicting ways they felt about their experience (a mixture of stress and healing).

Live Streaming Apps

These apps could be used for ethnographic research by providing opportunities for people to talk to each other in real-time and to comment using the built-in response message systems. These apps could also be used for online teaching or conference presentations.

Here’s a recent list of ‘best mobile living streaming apps’: 10 Best Mobile Live Streaming Apps (2020)

Photojournalism and Documentary photography

In progress

I’m working on the idea of how to document daily life of people in confinement at homes, but I find that it’s impossible to enter each house and photograph situations, life style (drama, children, routines, fights, duties…) due to the private and government’s rules of access to other homes.
A group of photographers had opened the idea to share pictures taken day by day and publish by Instagram social network. The group doesn't mention how many photographers are involved in countries and methodology.

There is a press silent of facts happening in the most affected countries -- Italy and Spain. Staff Photojournalists are at home and due to the unions they don't move to the spots with high infection and deaths. There are no graphic documents of hospitals without equipment but many testimonies along the RRSS from workers (graphic and tweets) confirming the lack of masks and other equipment for nurses and doctors.

So, documenting the virus very closely is really impossible also because photographers don't have the equipment to protect themselves when working outside home. Many countries in the EU closed borders with other countries and the freedom of movement was reduced. In Spain there are cases of photojournalists covering this pandemia that had been fined by police when on the streets.

How to document this pandemic as photojournalist, anthropologist or documentary photographer without having been punished by authorities?

When all this situation finishes and we stop the curve, what kind of reliable graphic and testimonial material will we get to use as scientific evidence? In the RRSS there are many photos from private people, but many of them are memes and don't have a professional point of view. I mean, the visual anthropology should work close to the governments and authorities to create a body of work enough to be an evidence for the study of other sciences?

Situations like buy and stock a big amount of food and toilette paper should be documented at homes and interview to the families asking the reason. Sociologically there are several reasons on this point, most of them by panic spread by the media. In the first days of the announcement of "state of alarm", the main products like bread, fruit, vegetables, pasta and other envased in cans was not available in any of those places.

Any ideas of suggestions are welcome for doing the fieldwork in this pandemia.

Studying Europe online

Added by Lisanne Wilken

This is the curriculum for a course, Europe Online, I teach at European Studies, Aarhus University. It is an interdisciplinary course which draws on several disciplinary approaches including ethnography

Lesson 1, September 6, 10-14, 1453/229

Introductions & Methodologies

https://www.researchgate.net/publication/319472120_Netnographic_Analysis_Understanding_Culture_through_Social_Media_Data

Lesson 2, September 10, 10-14. 1485/238

Online disinformation and fake news

DiFranzo, Dominic & Kristine Gloria Garcia (2017) Filter Bubbles and fake news. The ABC Magazine

Lesson 3, September 20

The EU on the Internet: Communication, election and public sphere?

**Background:**

**Lesson 4, September 24, 10-14, 1485/238**

**Terrorism on social media**

**Lesson 5, October 1st 10-14, 1485/238**

**Brexit on the internet**

**Lesson 6, October 8 10-14, 1453/229**

**Refugee crisis online**

Doing online interviews (added by Alexia Maddox)

An online interview is a structured conversation, consisting of the question set, an interviewer, an interviewee and the technology used to conduct and record the interview. What makes them different to an in-person interview is:

- The role of the technology in facilitating real-time co-presence and interactivity
- The approach the interviewer takes to build rapport and curate the conversation.

There is now a swath of scholarship on how to conduct an online interview, including this early article by Hinchcliffe and Gavin (2009) studying the use of instant messenger for synchronous interviewing. Early studies focused on comparing offline (in person) practices with the results from remote practices such as telephone interviewing (Irvine 2011).

A quick look at the available technology today suggests that online interviewing can be done through mundane everyday communicative practices and objects. An online interview can be done by your mobile phone or through your laptop using audio-visual interfaces such as Skype (Janghorban et al 2014), or Zoom, or by text chat through IRC for example (Barratt & Maddox)
2016). This means that they can be conducted with audio-visual interactivity and textual synchronicity.

Asynchronous interviewing, by email for example, is also possible and may be more convenient for some but lacks that live interplay and depends on the participant actually taking the time to write out their responses (Bampton, R., Cowton, C., & Downs, Y. 2013; Burns 2010). For some, this is too much labour.

What are they good for?
- Live interviews allow for the interviewer to seek clarification and follow threads of the conversation.
- They also allow for the ability of the interviewer to check that they understand the meaning of what the participant has said.
- Online interviews mean that you can conduct a real time interview, with another person, in a conversational format, but be in different spatial locations and contexts.
- It is possible to conduct anonymous interviews using IRC text chat and some other website interfaces.

How do I design my questions?
Design your interview questions to start from an easy soft opening question that a) draws on the expert knowledge or life experience of your interview participant and b) is relevant to scope of the interview. Work up to more complex questions and go out with a meaningful yet “feel good” question that allows your participant to say what they think.
- Be sure to ask the key questions that you want insights into that focus on the participants opinion and experience.
- Make sure your questions are simple, clear, relevant and to the point.

How do I set up an online interview?

Plan:
Setting up an interview online takes planning. It helps to plan how you will approach the interview, how you will coordinate your interview times with your participants and how you integrate technology into your interview process. Write your interview question set before you do the interview, and even test it out on a willing friend.

Coordinate:
To coordinate interviews across timezones, you can use this handy website to determine the time overlap between you and your interviewee https://www.timeanddate.com/worldclock/meeting.html Some people use meeting calendar software where they show what timeslots they are available and people check the slot they want. This can act in lieu of using email to coordinate a shared
time to conduct the interview. Here are a few options:
https://zapier.com/blog/best-meeting-scheduler-apps/

Test:
You need to test your interview tech and make sure it works to support an effective interview. Check your mic, that your software is working, and that you can get a clear recording or effective notes from your interview.

Doing the interview

Set and Setting
Find a quiet place to do the interview. This helps so that you can focus on what the person is saying and will help you to capture the conversation.

Capturing what is said
You can either record the interview through the software you are using to conduct the interview or on your smartphone or smart device such as an iPad. Check with your participant about what they are most comfortable with of these options.

Make sure you have a pen and notepad as a simple back up that will work. In it, you can have your questions and also take notes. It always helps to take notes while you are doing the interview to keep track of the questions you want to ask that arise from the conversation you are having.

Interview length
Most busy professionals would appreciate an interview that is 20 minutes at the most. Make sure you clarify on their time availability and ask all your key questions within that time.

Introduction
You should start the interview by using a short summary statement to state what the interview is about and ask them if they are comfortable to proceed with it. Prior to the interview, you should have sent them an email with this basic information and confirming interview length, style of questions and location.

During the interview
Ask your first question and listen to what they have to say. This interview is about their opinion rather than your own, so listening is key. Ask for clarification of anything that they have said that you don’t understand or would like to know more about.
If the interviewee goes off track, politely bring them back to the question at hand and keep the time in mind.
Summarise the ideas they have shared with you to indicate that you have understood what they have said.

**Closing the interview**

When you’ve asked your last question, ask them if there is anything more they would like to add. When you have both finished the conversation, thank them for their time and let them know what you will do with this knowledge they have provided you. (i.e. use it for your assessment task and also consider how you can shape your learning and career practices using this knowledge.

**Getting consent**

Obtain permission from your interviewee to use the content of the interview in your assessment piece and include this permission as an appendix in your assessment submission. You can get this at the time by providing a short, 1 pager summarising the interview and containing a line of it with the interviewee’s name and something that says "I consent to the information I have provided in this interview being used for assessment purposes” and a place for their signature and date.
